                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes crystals of a complex (C) of epithelial growth factor receptor (EGFR), containing a dimer of a complex of EGF with EGFR in the molar ratio 1:1.

Also described: (1) preparation of EGFR which can be crystallised, in Also described: (1) preparation of EGFR which can be crystallised, in which recombinant EGFR is prepared using Lec8 cells and then complex of EGFR is prepared using Lec8 cells and then complex of the accomplex of EGFR activity regulator (1), in which crystallisable EGFR is contacted with EGF or (1); (3) screening potential crystallisable EGFR; is contacted with EGF or (1); (3) screening potential (1) by determining the fit of the 3D structure of (1) to that of the EGF EGFR complex; (4) substances obtained by the screening method for use as agonists and antagonists of EGFR; (5) screening EGFR mutants

CC EGF. EGFR interaction site, by comparing their 3D structure to that of EGF eGF-EGFR; (5) design of epitopes using their 3D structure of the EGF-EGFR complex; (5) design of epitopes using their 3D structure of the EGF-EGFR complex; (6) preparation of anti-EGF or anti-EGFR antibodies prepared by the method; and (8) polypeptides and their salts containing all or part of the amino acid sequence of the EGFR dimerisation site. (C) has critian method; and (8) polypeptides and their salts containing all or part of the amino acid sequence of the EGFR dimerisation site. (C) has critian and prevention of cancer and cancer proliferation, liver continued and prevention of cancer and cancer proliferation, liver continued and prevention of cancer and cancer proliferation, liver continued and prevention of substances and antagonists of EGFR for use in the continued from disorders, unless and ringworm. The present sequence represents a human ErbBz amino acid sequence, which is used in the exercise of the effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Crystalline complex of epithelial growth factor with its receptor for design of ligands and antibodies to the receptor for treatment of ulcers, cancer and Parkinson's disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a non-naturally occurring human epidermal growth factor receptor (HER)-3 variant polypeptide comprising amino acids 19-329 or 20-329 of the 1342 amino acid HER3 polypeptide (ADB6761) or a sequence which differs from native HER3 polypeptide and having amino acid substitutions at residues E43, N44, K51, E64, V66 and V110 of S1, is new. The variant HER-3 specifically binds to the heregulin polypeptide (ADB67621), or has an ability to interact with HER2 polypeptide (ADB67621), or has an ability to inhibit the interaction between wild-type HER3 and heregulin. The polypeptide is useful for identifying a compound which specifically binds to heregulin binding domain in a HER3 variant polypeptide. The method further involves determining whether the test compound inhibits or enhances the heregulin induced tyrosine kinase activity associated with a HER3 polypeptide. The polypeptide is also useful for determining whether a test compound modulates the interaction between a heregullin polypeptide, and the variant HER-3 polypeptide is also useful for variant HER-3 polypeptide is also useful for

The invention may also be useful for the development of cytostatic compounds through the regulation of the expression of a gene or activity of a protein associated with malignant neoplasia. The method is useful for prediction, diagnosis or prognosis of malignant neoplasia such as breast cancer, ovarian cancer, pastric cancer, colon cancer, ossophageal cancer, ovarian cancer, bladder cancer or non-small cell ung cancer. The polymucleotides and polypeptides defined in the specification, antisense polymucleotides targeting the polymucleotides, antibodies targeting either one of the polymucleotides, and compounds identified by the screening methods are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human PRO polypeptides and the polynucleotides encoding them. The polypeptides and polynucleotides are useful for treating and diagnosing immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, systemic sclerosis, Sjogren's syndrome, vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central or peripheral nervous system, demyelinating polyneuropathy, polyneuropathy. This sequence represents a human PRO polypeptide of the invention.

TYCHLY

Sepidermal growth factor receptor precursor - chicken

Njochtains: protein-tyrosine kinase (EC 2.7.1.112) erbB

Cjacies: Gallus gallus (chicken)

Cjacie: 28-Feb-1986 #sequence_revision 05-May-1995 #text_change 09-Jul-2004

CjAccession: A27720; A00643

Rjax, I: Johnson, A.; Howk, R.; Sap, J.; Bellot, F.; Winkler, M.; Ullrich, A.; Vennst.

Title: US-09-806-703A-4_COPY_24_1255

Perfect score: 6694

1 OVCTGTDMKLRPASPETHL......FFKGTPTAENPEYLGLDVPV 1232

Scoring table: BLOSUM62

Gapop 10.0, Gapext 0.5

Searched: 1825181 seqs, 575374646 residues

Total number of hits satisfying chosen parameters: 1825181

Minimum DB seq length: 0

Maximum DB seq length: 2000000000
```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
